

Factoring by Grouping

Jonathan R. Bacolod

Sauyo High School

How to Factor Polynomials by Grouping?

1. Factor out the greatest common monomial of all terms of the given expression.

How to Factor Polynomials by Grouping?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Divide the polynomial into two groups: the first half and the second half.

How to Factor Polynomials by Grouping?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Divide the polynomial into two groups: the first half and the second half.
3. Factor the GCF out of the first half and factor the GCF out of the second half.

How to Factor Polynomials by Grouping?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Divide the polynomial into two groups: the first half and the second half.
3. Factor the GCF out of the first half and factor the GCF out of the second half.
4. You should have a common binomial factor.

How to Factor Polynomials by Grouping?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Divide the polynomial into two groups: the first half and the second half.
3. Factor the GCF out of the first half and factor the GCF out of the second half.
4. You should have a common binomial factor.
5. Factor out the common binomial factor.

Thank you for watching.
