

Factoring General Trinomials

Jonathan R. Bacolod

Sauyo High School

What are the Types of General Trinomials?

1. Trinomial in the form of $ax^2 + bx + c$, where $a = 1$

What are the Types of General Trinomials?

1. Trinomial in the form of $ax^2 + bx + c$, where $a = 1$
2. Trinomial in the form of $ax^2 + bx + c$, where $a \neq 1$

How to Factor General Trinomials?

1. Factor out the greatest common monomial of all terms of the given expression.

How to Factor General Trinomials?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Multiply the first term and the last term of the trinomial.

How to Factor General Trinomials?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Multiply the first term and the last term of the trinomial.
3. Get the possible factors of the product of the first term and the last term in such a way that their sum is equal to the second term of the trinomial.

How to Factor General Trinomials?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Multiply the first term and the last term of the trinomial.
3. Get the possible factors of the product of the first term and the last term in such a way that their sum is equal to the second term of the trinomial.
4. Replace the middle term by the two factors.

How to Factor General Trinomials?

1. Factor out the greatest common monomial of all terms of the given expression.
2. Multiply the first term and the last term of the trinomial.
3. Get the possible factors of the product of the first term and the last term in such a way that their sum is equal to the second term of the trinomial.
4. Replace the middle term by the two factors.
5. Apply factoring by grouping.

Thank you for watching.
